

# Why Do a Proof of Concept with Query.AI?

In managing cybersecurity operations, we understand there are a lot of potential projects that compete for your time and attention. So why put a Query.AI proof of concept (POC) at the top of your list?

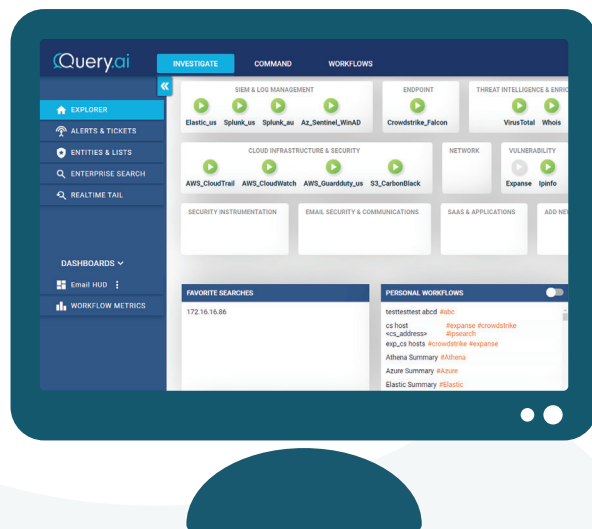

Simply stated, your POC with Query.AI will quite possibly be the most lightweight evaluation you conduct all year, and it will give you valuable insights into how you can cut security costs while greatly improving the speed and accuracy of your investigations.

## What is the Query.AI security investigations control plane?

Every company's data is decentralized, sitting in data silos. Our security investigations control plane overlays and serves as the connective tissue across your data silos, so you can access and analyze data in real-time from across systems, directly where it lives.

This removes the tedious and lengthy process of investigating from one security tool to the next. Instead, you can get all the answers back from your tools by just asking a single question.

The browser-based, patented platform automatically normalizes and enriches your data, delivering meaningful insights about your whole environment in a single console. This approach makes it incredibly efficient to manage investigations and swiftly initiate response actions—you guessed it, with a click directly from your Query.AI browser.

# How the Query.AI POC works

For 30 days, you get full access to the Query.AI platform that puts the power of fast, effective investigations at the fingertips of everyone on your team.

## What we do

We'll agree to your technical- and business-level criteria for a successful POC, as well as your three most important integrations. Then, we'll get started.

## What you get

Our team is here to help you throughout your POC. At the close of your 30-day POC, we'll meet with you to conduct a data review to outline the technical wins and outcomes of your evaluation based on the defined success criteria. We'll then develop a deep dive and host a wider meeting along with your stakeholders to review the success metrics and measurable value to the business.

## Fast and hassle free

With our browser-based architecture, this will be the most lightweight security solution you will implement all year—no complex installations or upgrades for hardware, software, and storage required. Just connect the APIs for the primary tools that are defined in the success criteria, and you're ready to get started.

## No need to worry about data privacy

Of course, investigations rely on data, so to move forward with your POC, you might be wondering, "how does Query.AI handle my data?" The great news is that with a platform architecture that doesn't store, process, or require vendor access to your data, Query.AI alleviates privacy and governance concerns about your enterprise data.

## Successful outcomes, absolutely!

To ensure your successful POC, we work with you to identify your opportunities for improvement in security investigations and tailor your evaluation to ensure you can address those challenge areas, allowing you to:

- ✓ Accelerate and increase confidence in the outcomes of your investigations; and
- ✓ Amplify your team's potential and make it easier to onboard new analysts.

We got this. We'll prioritize your success criteria, and get you on the path to achieve those outcomes.
